

## Based

The most common encoding is XOR and base64. Every CTF got base64 so if you are active in CTFs you might identify that this is a base64 encoding. There are many tools but I used <https://www.dcode.fr/> and <https://gchq.github.io/CyberChef/> to decode everything. For this just open cyberchef not dcode because in dcode you need to type base64 and redirect to another page, but for cyberchef just drag from the favourites panel on the left so its faster (even for a little faster I still called it time efficiency because I got another CTF to play). Drag “From Base64” and paste the ciphertext at the input
