

# Fat Fingers

## How Does it Work?

Everything is shifted one letter over from the QWERTY keyboard. S is translated to D, D to F, and so on.

## Possible Solutions

You could literally do this by hand and it would be faster and probably more accurate than a program someone writes. There is no easy way (that I am aware of) to implement this other than a mapping of characters to other characters. ASCII and Unicode are alphabetical. This is a tedious solution.
