

# Polar Bear

## Solution

The description of the challenge has a few things. One, is a string of numbers which is not obvious as to what it's for. Two, is the author saying they love Node.js and made a beginner project with it. There are many beginner Node.js projects it *could* be, but to spoil the fun it is a discord.js project.

The string of numbers is an ID of the Polar Bear bot. Once you realize it's a discord.js project, there are a couple things you could do. First, in Discord, if you have a client or user ID, sending a message in the format `<@/ID>` will ping the user, showing the user profile of the Polar Bear bot which can be added to a server. Another way of adding the bot to a server is with the Discord permissions calculator. It generates an invite for any discord bot given a list of authorized access and a client ID.

Once the bot is on the server, there is a single global slash command. Once ran, the flag is sent.
